PAKISTAN: Overview

As per a community-based study in Pakistan¹, the prevalence of vulvovaginal infections (VVI) is:

Vulvovaginal infections (VVI), such as bacterial vaginosis (BV) and trichomoniasis, have been shown to be associated with¹:

- Adverse outcomes of pregnancy
- Maternal mortality and morbidity
- Increased risk of human immunodeficiency virus (HIV) infection

Vulvovaginitis, an impact on women's daily life

Despite therapeutic advances, vulvovaginal candidosis remains a common problem²:

- Affecting 70–75% of women at least once during their lives, most frequently young women of childbearing age.
- 40–50% of women will experience a recurrence.

ZELESSE moisturizes, soothes and prevents the appearance of infections
